

ABSTRACT OF THE DISCLOSURE

A shock absorbing unit includes a fixation plate superposed and detachably fixed on the outer surface of an internal component. An erect plate continuously extends from the fixation plate so as to stand on the outer surface of the internal component. A pair of elastic leaves are superposed and adhered on front and back sides of the erect plate. The elastic leaves serve to absorb an impact or vibration. The internal component can be protected or separated from the impact or vibration. Moreover, the shock absorbing unit can be attached to or detached from the internal component as a whole in a relatively facilitated manner. When the elastic leaves are to be replaced with new ones, the shock absorbing unit as a whole may be replaced with a new one without unsticking the elastic leaves from the erect plate.
